

Release Notes for Controller SW upgrade 1.56

- Added several Legacy NHT speakers (Model 2.5i, 3.3, 1.5, VT 2, etc.) and new Verve speakers added to NHT Speaker Wizard
- Filter parameters are further optimized for all speakers in NHT Speaker Wizard for even better performance with current speaker models (Classic, Xd, Evolution, Architectural and Verve).
- Improved front panel user interface menu for easier use. Now the display shows only Sources 1 – 5 and -> to Sources 6-10 with -> to Setup and Mode options.
- Improved touch wheel navigation and proximity sensor for more intuitive and robust operation.
- New feature called Maximum Volume setting added to user interface under Audio Setup menu allows a maximum volume level to be set.
- Smoother playback when skipping CD/DVD tracks and changing TV channels, etc. (no more hiccups)
- Improved auto calibration performance for more robust operation in low gain speaker systems or absorptive environments.
- Fixed subwoofer level calibration (6dB hot on previous release).
- Several HDMI improvements for better compatibility with different devices.
- Zone source names changed to match the analog inputs #1 – 6 plus Tuner (previously associated with source memories 1 – 7 which causes confusion).
- Tuner country setting now in Misc Setup allowing a single version of Controller rather than 3 different International versions.
- Higher available maximum volume when no subwoofer is used (tower speakers like Classic Four).
- Fixed headphone detection bug. Some Controllers used to detect headphones when they weren't connected and low frequency content was played back loud.
- New menu navigation ability using front panel display touch-buttons as well as touch-wheel.
